Manual Information

Revision History

Each page of the document has the document part number and revision letter at the bottom of the page. The revision letter changes whenever the document is updated.

Revision	Date	Comment
A	21 March 2002	Initial release for software version 2.

Purpose

This manual provides technical information for maintaining the equipment. Use it as a guide for maintenance and electrical repair of parts considered field repairable.

Intended Audience

Users of this manual are expected to have a background in electronics, including analog and digital circuitry with RF and microprocessor architectures. It is intended for service representatives and technical personnel who maintain, troubleshoot, or repair this equipment.

Safety Information

Responsibility of the Manufacturer

GE Medical Systems *Information Technologies* is responsible for the effects of safety, reliability, and performance only if:

- assembly operations, extensions, readjustments, modifications, or repairs are carried out by persons authorized by GE Medical Systems *Information Technologies*, Inc;
- the electrical installation of the relevant room complies with the requirements of the appropriate regulations; and
- the device is used in accordance with the instructions for use.

Intended Use

This device is intended for use under the direct supervision of a licensed health care practitioner.

This device is not intended for home use.

Federal law restricts this device to be sold by or on the order of a physician.

Contact GE Medical Systems *Information Technologies* for information before connecting any devices to the equipment that are not recommended in this manual.

Parts and accessories used must meet the requirements of the applicable IEC 60601 series safety standards, and/or the system configuration must meet the requirements of the IEC 60601 medical electrical systems standard.

Periodically, and whenever the integrity of the device is in doubt, test all functions.

The use of ACCESSORY equipment not complying with the equivalent safety requirements of this equipment may lead to a reduced level of safety of the resulting system. Consideration relating to the choice shall include:

- use of the accessory in the PATIENT VICINITY; and
- evidence that the safety certification of the ACCESSORY has been performed in accordance to the appropriate IEC 60601-1 and/or IEC 60601 harmonized national standard.

If the installation of the equipment, in the USA, uses 240V rather than 120V, the source must be a center-tapped, 240V, single-phase circuit.

Warnings, Cautions, and Notes

Definitions

Warnings, cautions, and notes are used throughout this manual to designate a degree or level of hazardous situations. Hazard is defined as a source of potential injury to a person.

DANGER
Indicates an imminent hazard which, if not avoided, will result in death or serious injury.

WARNING
Indicates a potential hazard or unsafe practice which, if not avoided, could result in death or serious injury.

CAUTION
Indicates a potential hazard or unsafe practice which, if not avoided, could result in minor personal injury or product/property damage.

NOTE
Provides application tips or other useful information to assure that you get the most from your equipment.

Messages

WARNINGS
FALSE CALLS—False low heart rate indicators or false asystole calls may result with certain pacemakers because of electrical overshoot.

MONITORING PACEMAKER PATIENTS—Monitoring of pacemaker patients can only occur with the pace program activated.

PACEMAKER SPIKE—An artificial pacemaker spike is displayed in place of the actual pacemaker spike. All pacemaker spikes appear uniform. Do not diagnostically interpret pacemaker spike size and shape.

PATIENT HAZARD—A pacemaker pulse can be counted as a QRS during asystole in either pace mode. Keep pacemaker patients under close observation.

WARNINGS

RATE METERS—Keep pacemaker patients under close observation. Rate meters may continue to count the pacemaker rate during cardiac arrest and some arrhythmias. Therefore, do not rely entirely on rate meter alarms.

EXPLOSION HAZARD — Do not use this equipment in the presence of flammable anesthetics, vapors or liquids.

CAUTION

FDA POSTMARKET SAFETY ALERT—The United States FDA Center for Devices and Radiological Health issued a safety bulletin October 14, 1998. This bulletin states “that minute ventilation rate-adaptive implantable pacemakers can occasionally interact with certain cardiac monitoring and diagnostic equipment, causing the pacemakers to pace at their maximum programmed rate.”

The FDA further recommends precautions to take into consideration for patients with these types of pacemakers. These precautions include disabling the rate responsive mode and enabling an alternate pace mode. For more information contact:

Office of Surveillance and Biometrics, CDRH, FDA
1350 Piccard Drive, Mail Stop HFZ-510
Rockville, MD 20850
U.S.A.

NOTE

ECG monitoring with patients on non-invasive transcutaneous pacemakers may not be possible due to large amounts of energy produced by these devices. Monitoring ECG with an external device may be needed.

Equipment Symbols

The following symbols appear on the equipment.

ATTENTION: Consult accompanying documents before using the equipment.

Equipotential

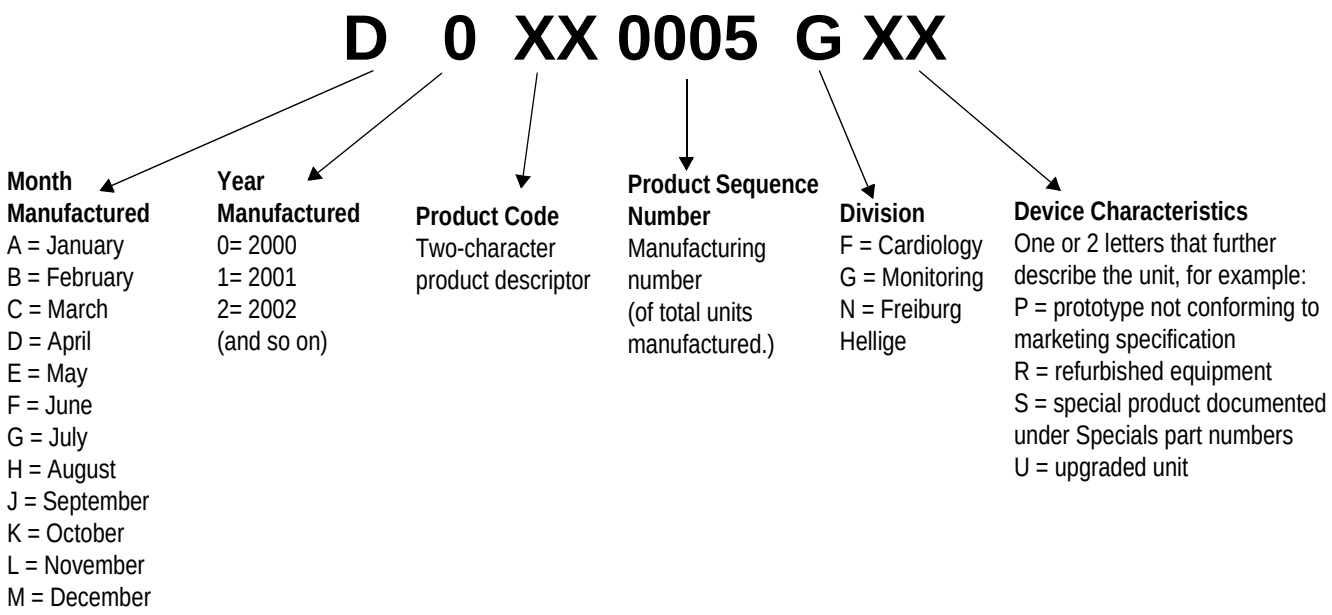
Service Information

Service Requirements

- Refer equipment servicing to GE Medical Systems *Information Technologies* authorized service personnel only.
- Any unauthorized attempt to repair equipment under warranty voids that warranty.
- It is the user's responsibility to report the need for service to GE Medical Systems *Information Technologies* or to one of their authorized agents.
- Failure on the part of the responsible individual, hospital, or institution using this equipment to implement a satisfactory maintenance schedule may cause undue equipment failure and possible health hazards.
- Regular maintenance, irrespective of usage, is essential to ensure that the equipment will always be functional when required.

Equipment Identification

Every GE Medical Systems *Information Technologies* device has a unique serial number for identification. The serial number appears on the product label on the base of each unit.



For your notes

2 Equipment Overview

For your notes

ApexPro Telemetry System Components

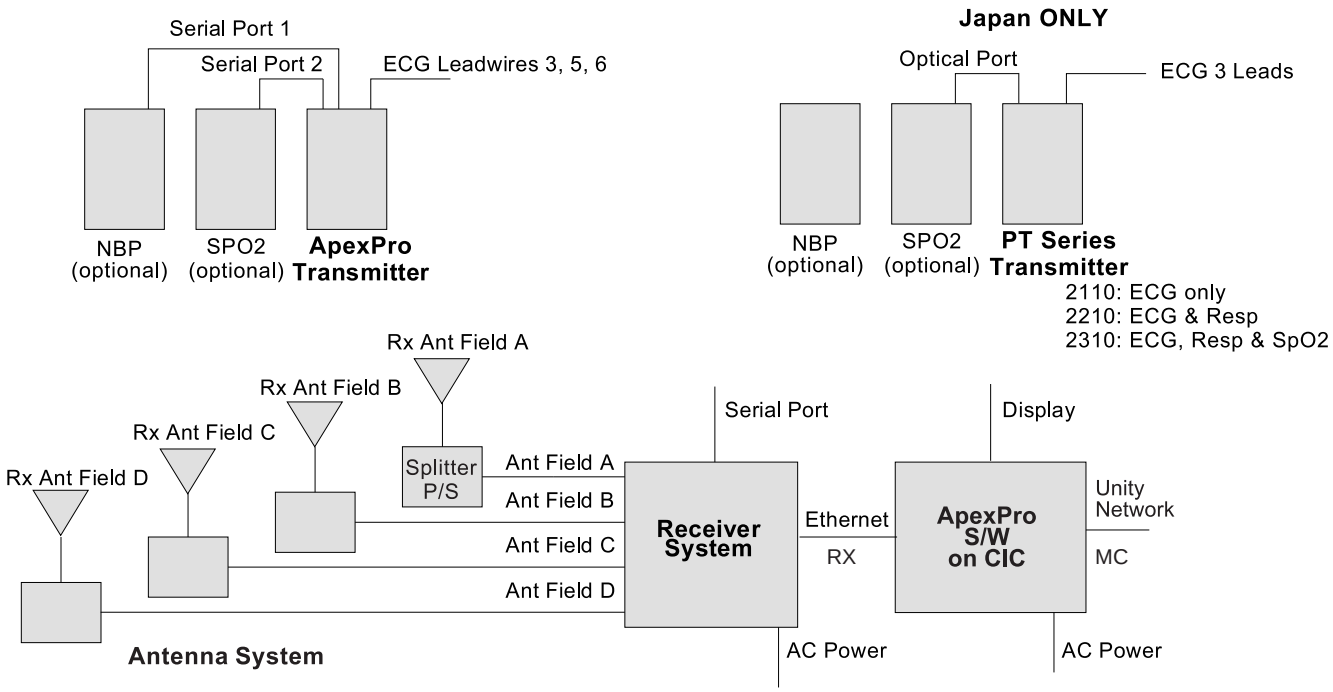
The ApexPro Telemetry System components include:

- Transmitter
- Antenna System
- Receiver System
- PC with Clinical Information Center (CIC) central station and ApexPro software

A transmitter is directly connected to the patient and transmits patient data via the antenna to a corresponding receiver. There is a one-to-one correspondence between transmitters and receivers. Up to 16 receivers (four quad receivers modules with four receivers on each) may reside in a Receiver System. Up to four quad receiver modules connect to the receiver backplane pcb, which is responsible for managing communications between all connected receivers and the telemetry host application software on the PC. The communication between the PC and the receiver backplane is 10BaseT Ethernet and is called the Receiver-Exchange (RX) network. The host application software then processes the patient data from the receivers and makes the patient's ECG parameter and waveform data available for display at network viewing stations or the Clinical Information Center (CIC) central station.

There are no user accessible functions in the Receiver System. It provides some configuration and diagnostic functions available to service personnel through a serial port.

ApexPro Telemetry System Block Diagram



For details on the transmitter, antenna, or CIC see the corresponding service manual.

Transmitters

ApexPro Transmitter

The ApexPro transmitter is a narrow channel UHF transmitter that accepts two serial ports, and 3-, 5-, and 6-leadwire sets. A 6-leadwire set includes RA, LA, LL, Va, RL, and Vb. RL is used as the reference leadwire. The transmitter has four ECG channels containing leads II, III, Va, and Vb. The versions of the transmitter differ in the frequency range of their output; a “U.S.” frequency range (584-614MHz), and an “international” frequency range (420-460MHz).

The ApexPro transmitter acquires a patient's ECG, converts it to 10 bit resolution digital data, and serially broadcasts that information along with pace, additional parameters (from devices attached to the serial ports), and status in an RF signal. The transmitter displays battery and leadwire status along with alarm pause activation on the case LED's.

Refer to the ApexPro Telemetry Transmitter service manual for further details.

PT Series Transmitter

This transmitter is available for use in Japan only. The PT series transmitter is a narrow channel UHF transmitter that accepts one optical port device and a 3-leadwire set. The three leadwires include RA (-), LA (+), and LL (neutral). ECG Lead II is transmitted.

The PT series transmitter is available in three configurations:

- The 2110 transmitter monitors ECG only.
- The 2210 transmitter monitors ECG and respiration.
- The 2310 transmitter monitors ECG, respiration, and SpO2.

Respiration is measured by impedance using the lead set, or by temperature using an additional thermistor placed in the patient’s nose. SpO2 is acquired via an external probe that connects to a special SpO2 port on the transmitter.

The PT series transmitter acquires a patient’s ECG, converts it to 11 bit resolution digital data, and serially broadcasts that information along with pace, respiration waveform, SpO2 waveform and saturation, additional parameters (from a device attached to the optical port), and status in an RF signal. The transmitter has an on/off switch and an LCD display that indicates its status.

Antenna System

The Antenna System includes the receiver antenna and all associated components up to, but not including, the Receiver System. There are two versions of the Antenna System; one for U.S. applications (560–614MHz), and one for international applications (420–474MHz).

The Antenna System conducts information transmitted by the transmitter to the Receiver System for demodulation and waveform processing. The Antenna System increases the reception area of the receiving system allowing the patient wearing the transmitter to move over a large area.

Refer to the ApexPro Antenna System Site Survey and Installation manual for further details.

Receiver System

The Receiver System's function is to selectively receive, demodulate, and decode a specified patient's data that has been transmitted from a transmitter and broadcast on the RX network to the host application. Patient data is not stored here. The Receiver System only knows TTX numbers assigned from the host and forwards data to the host where a patient name is assigned. See "Receiver System Description" on page 2-6.

The Receiver System provides these interfaces:

- F-connector inputs receive RF signals from the four antenna fields
- RLINK Ethernet connection, called RX (receiver exchange) network, through which the host application communicates to the receiver subsystem
- RS-232 asynchronous port provides terminal support for service related functions

Host Application

The ApexPro Telemetry System host software application does not provide user accessible functions. It runs as a service under the Windows NT operating system and relies on remote user interfaces such as the CIC. The ApexPro Telemetry System host software application resides on the Prism Information Server with CIC.

The ApexPro Telemetry System host software application

- analyzes data from the receiver system,
- assigns care unit and bed numbers to each receiver from the receiver system,
- directs and controls all operations including EKpro, trends, histories, ECG processing and alarms,
- stores data to the hard drive,
- assigns a receiver number and TTX number to the receiver system upon admit,
- sends data to the Unity MC network to the appropriate CIC for patient data display.

Receiver System Description

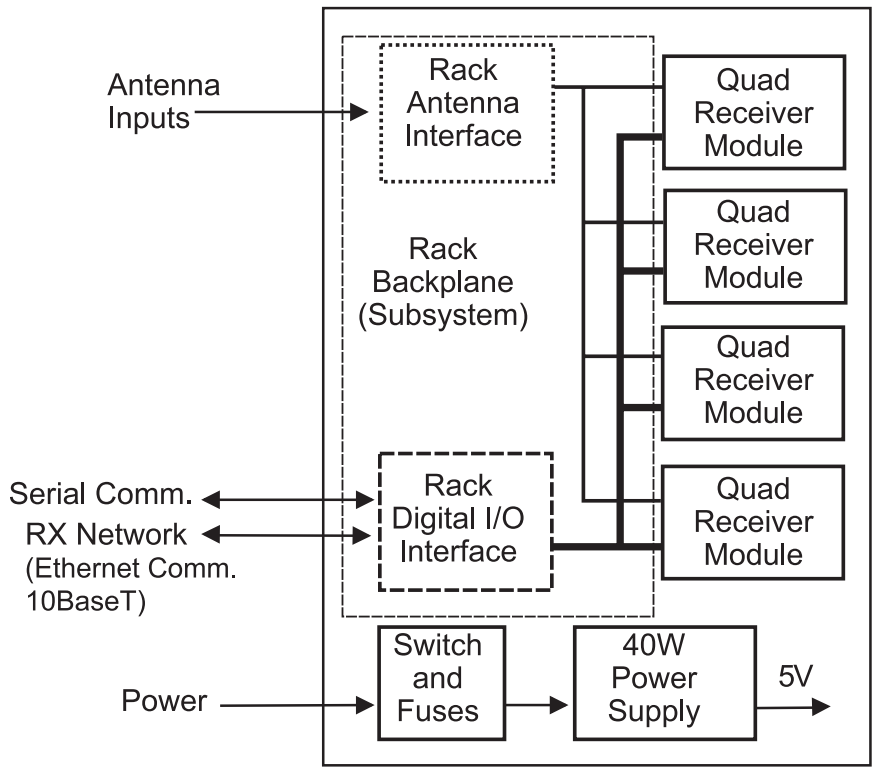
The Receiver System receives RF signals from the four antenna inputs. These inputs are for four separate, overlapping fields. The system performs the following functions:

- filters RF (backplane)
- distributes RF to quad receiver modules (backplane)
- demodulates and decodes transmitter data (quad receiver modules)
- retrieves decoded data (backplane)
- packetizes and sends data out over RX network (backplane)

The asynchronous serial communication port is for diagnostics, service and installation information.

The RX network is directly connected by a network crossover cable to a CIC with ApexPro. The RX network should not be installed on any other network.

Receiver System Block Diagram



Receiver Subsystem (Backplane)

The subsystem provides an interface between the quad receiver modules and the telemetry software running on the CIC connected via 10BaseT Ethernet. The subsystem accommodates up to four quad receiver modules. The subsystem performs the initial amplification and filtering necessary on the RF input signals from the transmitter.

Quad Receiver Modules

The quad receiver module receives the GMSK modulated RF signals from the transmitter through the receiver subsystem (backplane). The RF signals are mixed to an intermediate frequency, filtered, and mixed again to baseband and re-filtered. The baseband signal is separated into its in-phase and quadrature components then sampled. The DSP takes the samples, demodulates, corrects, and decodes packets of TLINK data. The information is passed on to the receiver subsystem for further processing and transport over Ethernet. Each module has four functionally identical receivers.

Technical Specifications

Performance Specifications	
Quad Receiver Module	
Type	GMSK or GFSK digitally demodulated
Frequency range	560.025MHz to 613.975MHz (U.S.) 420MHz to 474MHz (international)
Frequency step resolution	Frequency synthesized tuning to any transmitter. 25 KHz spacing.
Frequency stability	±0.00015% of assigned channel frequency
Demodulation	GMSK (ApexPro series), GFSK (PT series)
Bit rate	10 kb/sec (ApexPro series), 7.5 kb/sec (PT series)
Sensitivity	0.8 µV (–95 dBm) minimum for 1 bit error/1 million bits received
Receiver Subsystem	
Capacity	1 to 4 quad receiver modules (4 to 16 receivers)
System status indicators	7 bicolor LEDs (green and yellow)
Network	IEEE 802.3 compatible, physical connector via 10BaseT
Serial diagnostics	19200 baud, 1 stop bit, 8 data bits, no parity, XON/XOFF flow control

Environmental Specifications	
Power requirements	85 to 264 VAC, 47 to 63 Hz
Power consumption	25 watts max with 4 quad receiver modules (85.3 BTU/hr.)
Cooling	Free convection
Operating conditions	
Ambient temperature	0°C to 40° C (32°F to 104°F)
Relative humidity	10% to 90% (non condensing)
Storage conditions	
Temperature	–40°C to 70°C (–40°F to 158°F)
Relative humidity	15% to 95% (non condensing)

Physical Specifications	
Subsystem	
Height	170 mm (6.7 in)
Width	325 mm (12.8 in)
Depth	250 mm (9.8 in)
Weight	6.4 kg (14 lb) with 4 quad receiver modules

Certification	
Receiver Unit	FCC Part 15, Subpart B Class B (U.S. only)
Subsystem	UL 2601-1 Listed. IEC 60601-1 Certified. CE Marking. Yakuji (Japanese Ministry of Health, Labour and Welfare).
Warranty	
Standard warranty is one year. Other options are available.	

For your notes

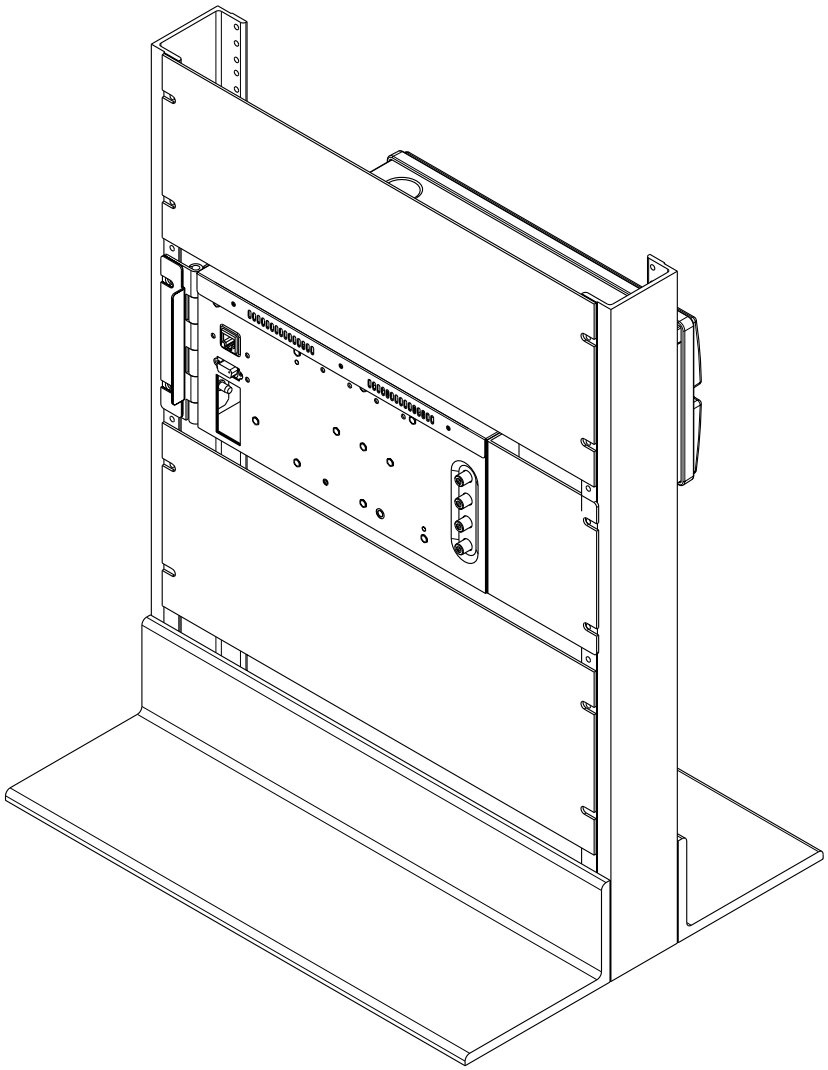
3 Installation

For your notes

Mounting Options

The mounting options for the ApexPro Telemetry System Receiver System are:

- Standard tabletop mount (four rubber feet)
- Optional rack mount for standard 19 inch network rack system with a 4U panel height (177.8mm/7in.). (Order rack mounting kit #2004232-001 separately.)



CAUTION

Mount the Receiver System securely and away from vibration. Vibration may cause patient waveform dropout at the CIC.

NOTE

If using rack mount, route all cables to the hinge side so the receivers are accessible for service. A right angle F-connector may be helpful for the coaxial cable.

Connections

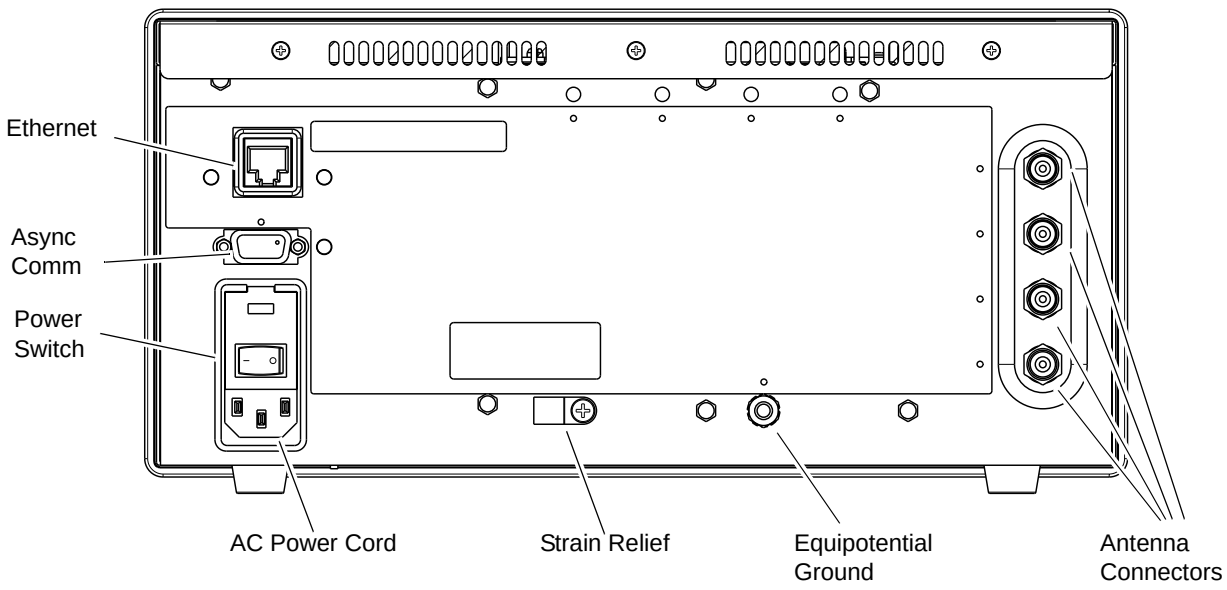
Keep the following in mind when connecting the system.

- Use a dedicated connection between the RX network and the CIC with ApexPro.
- If the distance between the CIC with ApexPro and the Receiver System is less than 100 meters (328 ft.), then use point-to-point with crossover cable (null modem) connection.
- If the distance is greater than 100 meters (328 ft.) then use either an additional hub or use fiber optic cable.

NOTE

Do not connect multiple Receiver Systems on the Unity MC, IX, or RX networks. A dedicated network is critical because it is real-time unprocessed patient data.

1. Connect the RJ-45 (RX network) to the Ethernet port.
2. Connect the coaxial antenna cables to the antenna inputs (two fields minimum, required). Unused antenna input jacks need to be terminated using part number 17100-001.
3. Connect the power cord to the AC power inlet. Secure the cord with the strain relief. Plug cord into emergency AC power outlet.
4. Indicate which CIC is directly connected by labeling the Receiver System with the care unit and CIC name. Place the label near the RX Ethernet port.
5. Switch the power switch to I (on).



Setup

Assuming that the CIC with ApexPro and all antennas have been installed and set up, the entire system is now installed and connected.

CAUTION
Equipment damage. If receiver system software needs updating, the system LED flashes yellow while software is updating. DO NOT power down the system during a software update.

1. Using the 9-pin, serial cable (PN 2003629-001) supplied with the transmitter programming kit, connect a PC to **Async Comm** (asynchronous serial communication) for setup.
2. At the PC, use a communication program such as Hyperterminal to set up the ComPort connection. For example:

Port:	Com1 (comm port on the PC)
Speed:	Baud 19200
Parity:	No
Stop Bit:	1
Data Bits:	8
Flow Control:	Xon Xoff

3. Press **Enter** to get the @> *Enter Service Password:* prompt.
4. Type password, **mms_aps** (case-sensitive).
5. Press **Enter**.
6. At the @> prompt type **sii**.
7. Type information for the following prompts:
   - *Enter Installer's Name/ID (31 Characters MAX):*
   - *Enter Installation Date (31 Characters MAX):*
   - *Enter Rack Location (31 Characters MAX):*
8. Check the information by typing **gii** at the prompt.
9. Exit the communication program, then disconnect serial cable and PC.
10. Go to chapter 4, Maintenance and complete the Receiver System Checkout procedures to make sure the Receiver System is working properly.

For your notes

4 Maintenance

For your notes

Maintenance Schedule

Manufacturer Recommendations

To make sure the Receiver System remains in proper operational and functional order, adhered to a good maintenance schedule. The manufacturer recommends the following:

- **Visual Inspection:** Service personnel should perform a visual inspection upon receipt of the equipment, every 12 months thereafter, and prior to servicing the unit.
- **Cleaning:** Service personnel should clean the unit upon receipt of the equipment, every 12 months thereafter, and each time the unit is serviced.
- **Checkout Procedure:** Service personnel should perform the checkout upon receipt of the equipment, every 12 months thereafter, and each time the unit is serviced.

Manufacturer Responsibility

WARNING

Failure on the part of all responsible individuals, hospitals or institutions, employing the use of this device, to implement the recommended maintenance schedule may cause equipment failure and possible health hazards. The manufacturer does not, in any manner, assume the responsibility for performing the recommended maintenance schedule, unless an Equipment Maintenance Agreement exists. The sole responsibility rests with the individuals, hospitals, or institutions utilizing the device.

Visual Inspection

The Receiver System and its components should be carefully inspected prior to installation, once every 12 months thereafter and each time the equipment is serviced.

- Carefully inspect the equipment for physical damage to the case. Refer damaged equipment to qualified service personnel.
- Inspect all external connections for loose connectors or frayed cables. Have any damaged connectors or cables replaced by qualified service personnel.

Cleaning

Cleaning Precautions

Use one of the following approved solutions:

- Cidex solution, or
- Sodium hypochlorite bleach (diluted), or
- Mild soap (diluted)
- Lint-free cloth
- Dust Remover (compressed air)

To avoid damage to the equipment surfaces, *never* use the following cleaning agents:

- organic solvents,
- ammonia based solutions,
- acetone solution,
- Betadine solution,
- a wax containing a cleaning substance, or
- abrasive cleaning agents.

Exterior Cleaning

WARNING
Shock hazard. When cleaning the power unit, use a cloth dampened with cleaning alcohol on the outside of the enclosure only. Do not immerse the product in water or a safety hazard could arise during use.

Clean the exterior surfaces with a clean, lint-free cloth and one of the cleaning solutions listed above.

- Wring the excess solution from the cloth. Do not drip any liquid into open vents, switches, plugs, or connectors.

NOTE
To avoid getting liquid into connector openings, do not spray general cleaning solutions directly onto the product's surface.

- Dry the surfaces with a clean cloth or paper towel.

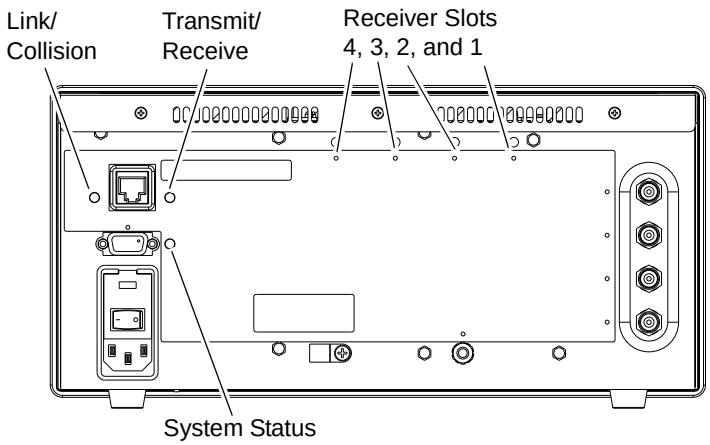
Receiver System Checkout

LED Status Indicators

Seven bicolor LEDs on the back of the Receiver System indicate the following:

LED	Solid Green	Flashing Green	Solid Yellow	Flashing Yellow	Blank
System Status	Normal Operation	System Initialization	System Error – System Halted	Software updating or Blink rack command at CIC	Power off
Receiver 1	Normal Operation	Module 1 Initialization	Module 1 Error	Single Receiver Error on Module 1 or Blink rack command at CIC	Not installed
Receiver 2	Normal Operation	Module 2 Initialization	Module 2 Error	Single Receiver Error on Module 2 or Blink rack command at CIC	Not installed
Receiver 3	Normal Operation	Module 3 Initialization	Module 3 Error	Single Receiver Error on Module 3 or Blink rack command at CIC	Not installed
Receiver 4	Normal Operation	Module 4 Initialization	Module 4 Error	Single Receiver Error on Module 4 or Blink rack command at CIC	Not installed
Link/ Collision	Link Established	N/A	N/A	Ethernet Collision Occurred	Not connected to host
Transmit/ Receive	N/A	Ethernet Transmission	N/A	Ethernet Reception	No transmit or receive

LED Locations



1. Switch power on.
2. Check that the **System Status**, **Transmit/Receive**, and appropriate receiver slot LEDs illuminate.

3. Verify that the **System Status** LED shows initialization status after power-up (flashing green).
4. Verify that all installed receivers initialize without error (**Receiver Slots** LEDs flashing green).
5. Verify that, after initialization, the **System Status** LED and all **Receiver Slots** LEDs are solid green.

CAUTION
Equipment damage. If receiver system software needs updating, the system LED flashes yellow while software is updating. DO NOT power down the system during a software update.

6. Verify **Link/Collision** LED is green.
7. Verify that the **Transmit/Receive** LED flashes yellow and green once every 5 seconds on first time setup. If patients are admitted on this Receiver System, then the receiver automatically transmits data (flashing green).

NOTE
After the Receiver System is powered up (power switch), it resets itself when the host connection is detected.

8. Verify that diagnostic information can be retrieved from the **Async Comm** (asynchronous serial) port via a laptop.

Ping the Receiver System

1. At the CIC with ApexPro that is connected to the Receiver System, click *Setup CIC*.
2. Select the *Service Password* tab.
3. Type the service password **mms_com**.
4. Type **ping 119.1.1.1**. (the Receiver System IP address).
5. Verify that the reply reads similar to the example.

   Pinging 119.1.1.1 with 32 bytes of data:
   Reply from 119.1.1.1: 32 bytes = 32 time <10ms TTL 255
   Reply from 119.1.1.1: 32 bytes = 32 time <10ms TTL 255
   Reply from 119.1.1.1: 32 bytes = 32 time <10ms TTL 255

   If time out message appears, refer to chapter 5, Troubleshooting.

Receiver Function

Follow all procedures sequentially to the end of this section to verify that all receivers are available and communicating with the ApexPro host application on the CIC.

1. Connect a patient simulator to a transmitter.
2. At the CIC with ApexPro, select *Setup CIC*.
3. Select the *Service Password* tab.
4. Type the password **mms_com**, then press **Enter**.
5. An MS-DOS command window opens displaying the prompt

   C:\Program Files\Marquette\CIC\X.X> (X= software version)
6. Type **cd** <space> **..\..\pts\2.X** (X= software version) and press **Enter**.
7. Verify the prompt

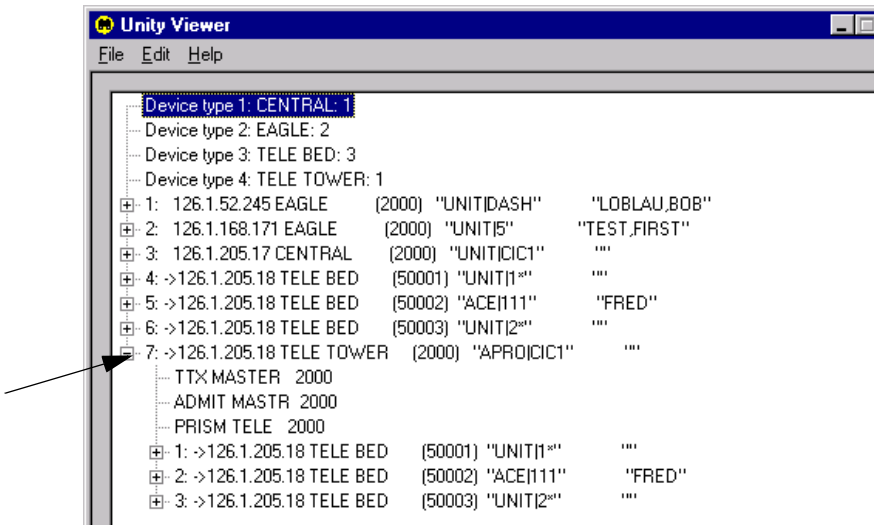
   C:\Program Files\Marquette\PTS\X.X> (X= software version)

Determine Number of Admitted Beds

1. At the prompt type **tools\unityviewer**.

   The *Unity Viewer* window opens.
2. In the *Unity Viewer* window click on the *Edit* menu and select *Configure*.
3. From the dropdown menu select a unity MC IP address (126.X.X.X) and click *OK*.

   The message *Waiting for network traffic...* appears.
4. In the displayed information, identify the ApexPro Unity MC IP address (see sticker on the PC unit) and click on the + (on the left) to expand.



5. This displays the number of beds admitted on the PC. Note this number and close the window.

Determine Number of Unassigned Receivers

1. In the MS-DOS window at the *PTS\X.X* prompt, type **ptsconfig** and press **Enter**.

NOTE

Type **help** at any time to see a list of commands.

2. Verify new prompt, Unity MC IP address of the ApexPro application, then *C:Program Files\Marquette\PTS\X.X*.
3. Type **display receiver** and press **Enter**.
4. Note the number of unassigned receivers and subtract this number from the number of admitted beds noted above.

   The number of beds correlates to the number of receivers indicated by the number of green **Receiver Slots** LEDs on the back of the Receiver System. Four receivers per one green **Receiver Slots** LED.

1 LED =	4 receivers
2 LEDs =	8 receivers
3 LEDs =	12 receivers
4 LEDs =	16 receivers

Test Available Receivers

1. Type **admit** <space> **care unit name** <space> **bed name** <space> **patient name** <space> **TTX#** <space> **patient age**, where

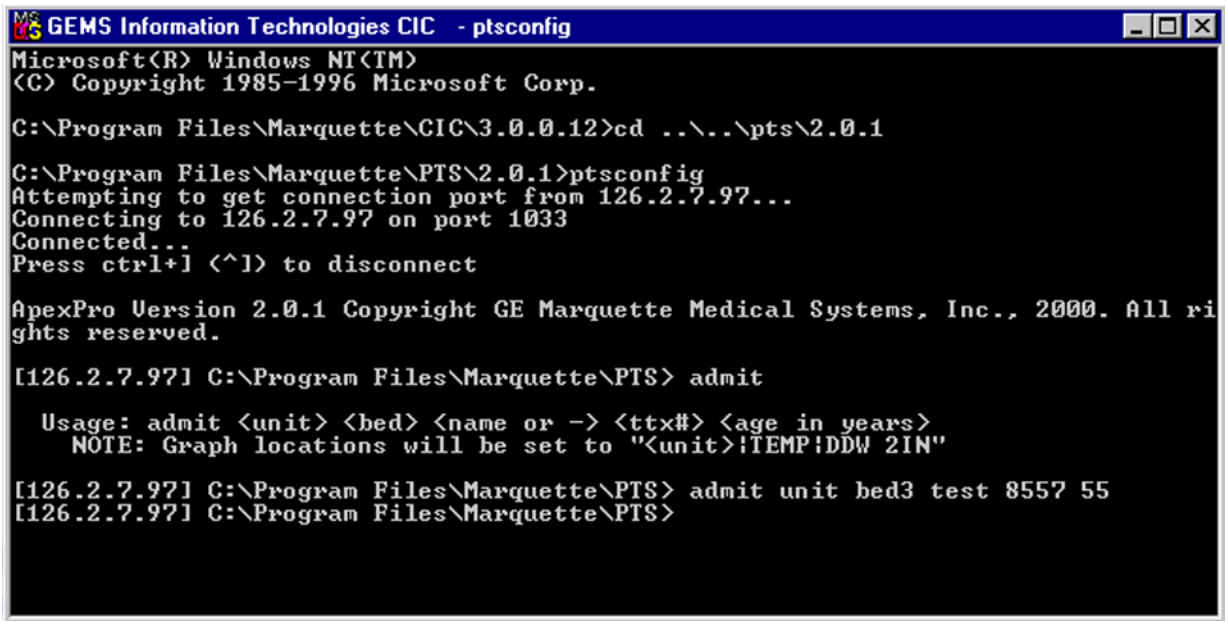
   care unit name = a temporary unique name for testing

   bed name = a temporary unique name for testing

   patient name = test

   TTX# = number of transmitter using for test (Use the number in parentheses on the transmitter label or in the CIC drop-down menu, e.g., 1071.)

   age = 55



2. Press **Enter** and minimize the MS-DOS screen.
3. Right-click on an empty available bed. Select newly admitted test bed.
4. Verify ECG waveform appears without dropout.
5. Restore the MS-DOS window.
6. Type **discharge** <**unit**>|<**bed**> and press **Enter**.
7. At the message, *Are you sure you want to delete?*, type **y**.
8. Repeat these steps for all remaining receivers.

Update Maintenance Record

Use the following commands to enter maintenance information on the Receiver System.

1. Using the 9-pin, serial cable (PN 2003629-001) supplied with the transmitter programming kit, connect a PC to **Async Comm** (asynchronous serial communication).

   At the PC, use a communication program such as Hyperterminal to update any maintenance information.

2. Press **Enter** to get the @> *Enter Service Password:* prompt.
3. Type password, **mms_aps** (case-sensitive).
4. Press **Enter**.
5. At the @> prompt type **smi**.
6. Type maintenance information.
7. Check the information by typing **gmi** at the prompt.
8. Exit the communication program, then disconnect serial cable and PC.

Electrical Safety Tests

Electrical safety tests provide a method of determining if potential electrical health hazards to the patient or operator of the device exist.

Recommendations

These instructions are intended for the Receiver System.

GE Medical Systems *Information Technologies* recommends that you perform all safety tests presented in this chapter.

- upon receipt of the device,
- every twelve months thereafter,
- each time the main enclosure is disassembled or a circuit board is removed, tested, repaired, or replaced, and
- record the date and results on the “Maintenance/Repair Log” included at the end of this chapter.

WARNING
Failure to implement a satisfactory maintenance schedule may cause undue equipment failure and possible health hazards. Unless you have an Equipment Maintenance Contract, GE Medical Systems *Information Technologies* does not in any manner assume the responsibility for performing the recommended maintenance procedures. The sole responsibility rests with the individual or institution using the equipment. GE Medical Systems *Information Technologies* service personnel may, at their discretion, follow the procedures provided in this manual as a guide during visits to the equipment site.

Test Conditions

Electrical safety tests may be performed under normal ambient conditions of temperature, humidity, and pressure.

Test Equipment

The recommended test equipment required to perform electrical safety tests is listed below.

Item	Specification
Leakage Current Tester	Equivalent to the circuits shown
Digital Multimeter (DMM)	AC volts, ohms
Ground Bond Tester	0 – 1 ohm
ECG Test Body	All leads together

Power Outlet Test

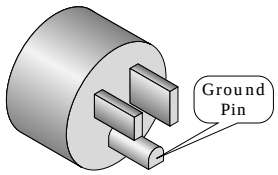
Before starting the tests, the power outlet from which the monitoring device will get electrical power must be checked. This test checks the condition of the power outlet to ensure correct results from leakage tests.

For international power outlets, refer to the internal standards agencies of that particular country. Use a digital multimeter to ensure the power outlet is wired properly.

If other than normal polarity and ground is indicated, corrective action must be taken before proceeding. The results of the following tests will be meaningless unless a properly wired power outlet is used.

Ground (Earth) Integrity

Listed below are two methods for checking the ground (earth) integrity, “Ground Continuity Test” and “Impedance of Protective Earth Connection.” These tests determine whether the device's exposed metal and power inlet's earth (ground) connection has a power ground fault condition.



Perform the test method below that is required by your Country/Local governing safety organization.

Ground Continuity Test

Completion of this test is checked by the following steps:

1. Disconnect the device under test from the power outlet.
2. Connect the negative (-) lead of the DMM to the protective earth terminal (ground pin in power inlet connector) or the protective earth pin in the Mains plug (ground pin in power cord). Refer to the US 120Vac power cord figure above.
3. Set the DMM to the milliohm (mΩ) range.
4. Connect the positive (+) lead of the DMM to all exposed metal surfaces on the device under test. If the metal surfaces are anodized or painted, scrape off a small area in a inconspicuous place for the probe to make contact with the metal.
5. Resistance must read:
   - 0.1 ohm or less without power cord
   - 0.2 ohms or less with power cord

Impedance of Protective Earth Connection

This test, unlike a ground continuity test, will also stress the ground system by using special ground bond testers.

This test normally is only required as a manufacturing production test to receive safety agency compliance (i.e., IEC 60601-1).

Some country agencies do require this test after field equipment repairs (i.e. Germany's DIN VDE 0751 standards).

Consult your country/local safety agency if in question.

Compliance is checked by the following steps:

1. A current not less than 10A and not exceeding 25A from a current source with a frequency of 50 or 60 Hz with a no-load voltage not exceeding 6V is passed for at least 5s through the protective earth terminal or the protective earth pin in the mains plug and each accessible metal part which could become live in case of failure in basic insulation.
2. The voltage drop between the parts described is measured and the impedance determined from the current and voltage drop. It shall not exceed the values indicated.

For equipment without a power supply cord, the impedance between the protective earth terminal and any accessible metal part which is protectively earthed shall not exceed 0.1 ohms

For equipment with a power supply cord, the impedance between the protective earth pin in the mains plug and any accessible metal part which is protectively earthed shall not exceed 0.2 ohms.

When taking this measurement, move the unit's power cord around. There should be no fluctuations in resistance.

Ground (Earth) Wire Leakage Current Tests

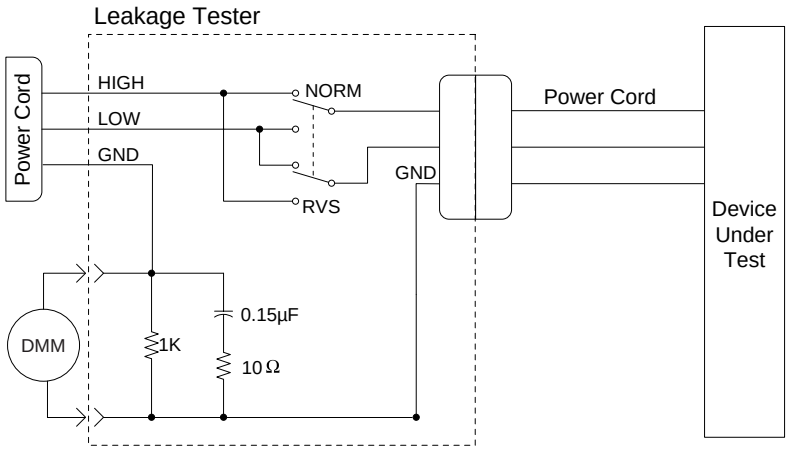
Perform this test to measure current leakage through the ground (earth) wire of the equipment during normal operation.

NOTE

The DMM plus leakage tester network shown is the circuitry defined by the UL 544 standard for measuring leakage current.

The measuring devices, defined by various standard organizations (IEC, UL, etc.), produce almost identical test measurement results.

1. Configure the leakage tester like the circuit shown below.



DMM set to measure AC voltage

2. Connect the power cord of the device under test to the power receptacle on the leakage tester.
3. The device under test is to be tested at its normal operating voltage.
4. Set the power switch of the device under test to ON.
5. Read the current leakage indicated on DMM.
6. Set the polarity switch on the leakage tester to RVS (reverse).
7. Read the current leakage indicated on DMM.

NOTE

If either reading is greater than the appropriate specification below, the device under test fails. Contact GE Medical Systems *Information Technologies* Technical Support.

- 300 µA (0.3 volts on the DMM), and the device under test is powered from 100-120 V/50-60 Hz
- 300 µA (0.3 volts on the DMM), and the device under test is powered from a centered-tapped 200-240 V/50-60 Hz, single phase circuit
- 500 µA (0.5 volts on the DMM), and the device under test is powered from a non-center-tapped, 200-240 V/50-60 Hz, single-phase circuit

NOTE

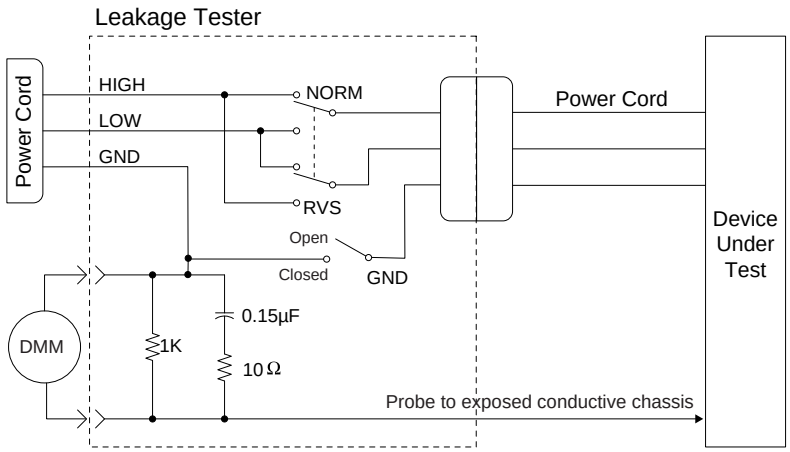
Center-tapped and non-center-tapped supply circuits produce different leakage currents and the UL and IEC limits are different.

8. Set the power switch of the device under test to OFF.

Enclosure Leakage Current Test

Perform this test to measure current leakage through exposed conductive surfaces on the device under test during normal operation.

1. Configure the leakage tester like the circuit shown below with GND switch OPEN and polarity switch NORM.



DMM set to measure AC voltage

2. Connect probe to an unpainted, non-anodized chassis ground on the unit under test.
3. Set the power switch of the device to ON.
4. Read the current leakage indicated on DMM.

NOTE

Center-tapped and non-center-tapped supply circuits produce different leakage currents and the UL and IEC limits are different.

5. Set the polarity switch to RVS.

6. Read the current leakage indicated on DMM.

   NOTE

   If either reading is greater than the appropriate specification below, the device under test fails. Contact GE Medical Systems *Information Technologies* Technical Support.

   - 300 µA (0.3 volts on the DMM), and the device under test is powered from 100-120 V/50-60 Hz
   - 300 µA (0.3 volts on the DMM), and the device under test is powered from a centered-tapped 200-240 V/50-60 Hz, single phase circuit
   - 500 µA (0.5 volts on the DMM), and the device under test is powered from a non-center-tapped, 200-240 V/50-60 Hz, single-phase circuit

7. Set the GND switch on the leakage tester to CLOSED.
8. Read the current leakage indicated on DMM.
9. Set the polarity switch to RVS.
10. Read the current leakage indicated on DMM.

    NOTE

    If the reading is greater than the specification below, and the device under test is powered from 100-240 V/50-60 Hz, the device under test fails. Contact GE Medical Systems *Information Technologies* Technical Support.

    - 100 µA (0.1 volts on the DMM), and the device under test is powered from 100-240 V/50-60 Hz

11. Set the power switch of the device under test to OFF.

Test Completion

1. Disconnect the leakage tester from the power outlet.
2. Disconnect all test equipment from the device.
3. Disconnect the device power cord from the leakage tester.

For your notes

5 Troubleshooting

For your notes

General Fault Isolation

Visual Inspection

A thorough visual inspection of the equipment can save time. Small things—disconnected cables, foreign debris on circuit boards, missing hardware, loose components—can frequently cause symptoms and equipment failures that may appear to be unrelated and difficult to track.

The following steps might seem trivial but it is highly recommended that they be performed to remove these "simple" failures as causes of problems.

- Set the ON/OFF switch to the OFF position and disconnect the Receiver System from its power source.
- Refer to the Disassembly Guidelines in Chapter 6, Parts Lists and Drawings and perform an internal visual inspection of the components.

Take the time to make all the recommended visual checks (refer to the visual inspection table below) before starting any detailed troubleshooting procedures.

Visual Inspection Table

Area	Look for the following problems:
I/O Connectors and Interface Cables	■ Fraying or other damage ■ Bent prongs or pins ■ Cracked housing ■ Loose screws in plugs ■ Excessive cable tension or wear ■ Secure mounting hardware
Internal Harnesses and Cables	■ Excessive tension or wear ■ Loose connection ■ Strain reliefs out of place
Circuit Boards	■ Moisture, dust, or debris (top and bottom) ■ Loose or missing components ■ Burn damage or smell of over-heated components ■ Socketed components not firmly seated ■ PCB not seated properly in edge connectors ■ Solder problems: cracks, splashes on board, incomplete feedthrough, prior modifications or repairs
Ground Wires/Wiring	■ Loose wires or ground strap connections ■ Faulty wiring ■ Wires pinched or in vulnerable position
Mounting Hardware	■ Loose or missing screws or other hardware, especially fasteners used as connections to ground planes on PCBs ■ Receiver System mounted loosely or near vibration
Power Source	■ Faulty wiring, especially AC outlet ■ Circuit not dedicated to system (Power source problems can cause static discharge, resetting problems, and noise.)

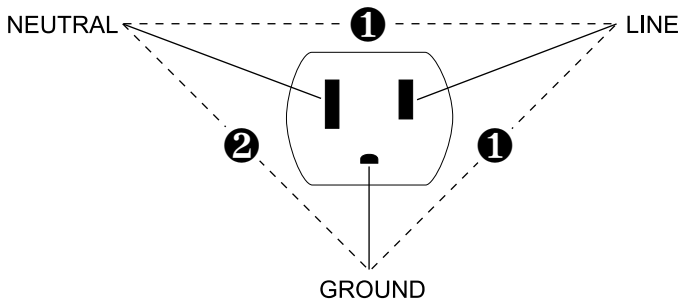
AC Line Voltage Test

This test verifies that the domestic wall outlet supplying power to the equipment is properly wired. For international wiring tests, refer to the internal standards agencies of that particular country.

120 VAC, 50/60 Hz

Use a digital voltmeter to check the voltages of the 120-volt AC wall outlet (dedicated circuit recommended). If the measurements are significantly out of range, have a qualified electrician repair the outlet. The voltage measurements should be as follows:

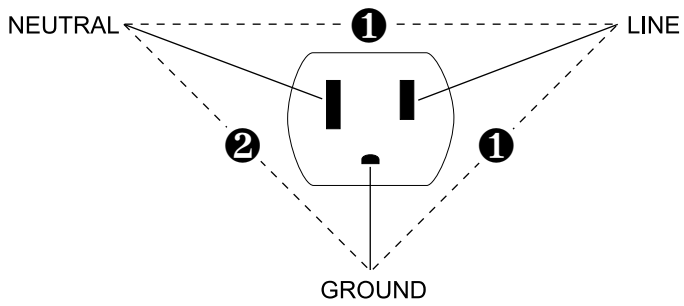
1. 120 VAC (± 10 VAC) between the line contact and neutral and between the line contact and ground.
2. Less than 3 VAC between neutral and ground.



240 VAC, 50/60 Hz

Use a digital voltmeter, set to measure at least 300 VAC, to check the voltages of the NEMA 6-20R, AC wall outlet (dedicated circuit recommended). If the measurements are significantly out of range, have a qualified electrician repair the outlet. The voltage measurements should be as follows:

1. 120 VAC (± 10 VAC) between either “hot” contact and ground.
2. 210 to 230 VAC between the two “hot” contacts.



Troubleshooting Procedure

Check LEDs

LED	Solid Green	Flashing Green	Solid Yellow	Flashing Yellow	Blank
System Status	Normal Operation	System Initialization	System Error – System Halted	Software updating or Blink rack command at CIC	Power off
Receiver 1	Normal Operation	Module 1 Initialization	Module 1 Error	Single Receiver Error on Module 1 or Blink rack command at CIC	Not installed
Receiver 2	Normal Operation	Module 2 Initialization	Module 2 Error	Single Receiver Error on Module 2 or Blink rack command at CIC	Not installed
Receiver 3	Normal Operation	Module 3 Initialization	Module 3 Error	Single Receiver Error on Module 3 or Blink rack command at CIC	Not installed
Receiver 4	Normal Operation	Module 4 Initialization	Module 4 Error	Single Receiver Error on Module 4 or Blink rack command at CIC	Not installed
Link/ Collision	Link Established	N/A	N/A	Ethernet Collision Occurred	Not connected to host
Transmit/ Receive	N/A	Ethernet Transmission	N/A	Ethernet Reception	No transmit or receive

If. . .	Then. . .
No LEDs On	1. Check the AC source for power. 2. Check the internal fuse. 3. Check the 5V power supply. 4. Cycle power.
Transmit/Receive LED flashes yellow every 5 seconds	Using the **Async Comm** port 1. Check the IP address (GIP command). 2. Set IP address, if necessary (SIP command)
Receiver module LED is flashing yellow	See the Problems/Solutions table on the next page.

Problems/Solutions

Refer to Theory of Operation in this manual for circuit board functions. Refer to the Disassembly Guidelines in Chapter 6, Parts Lists and Drawings to disassemble the unit.

Problem	Cause	Solution
Message "No receivers available" displays at the CIC or unable to ping the receiver.	Receiver System not connected to the Prism server.	Check that the RX network connection is good at both the Prism server and the Receiver System. Receiver System is connected to the wrong NIC at the CIC. (Refer to the Prism Information Server Service Manual.)
	Cross over cable is not used between the Receiver System and Prism server.	The RX network must be a peer-to-peer connection. Use a network cross over cable if no hub is used.
	The IP address has been modified.	1. Connect a PC to the **Async Comm** port on the Receiver and enter the communication program using the password **mms_aps**. (See chapter 3, Installation for serial setup.) 2. Type the command **gip** and press **Enter**. The displayed IP address should be *119.1.1.1*. 3. If the address is not correct, type **sip** and press **Enter**. 4. Type **119.1.1.1**, then reboot the Receiver System.
	Care unit on the CIC doesn't match the Receiver System configuration.	Run *PTSCONFIG.exe* at the CIC to configure the *Modify Receivers* command. (Refer to the Prism Information Server Service Manual.)
Need to determine which Receiver System is connected to a certain CIC/ ApexPro PC.		Use the service diagnostic tool *PTSCONFIG* at the CIC to flash the System Status LED on the receiver for 5 minutes. For example, *blink rack 126.x.x.x 5*
Cannot admit beds to the Receiver System. Need to associate a care unit/bed# to a receiver in a given rack.		Use the service diagnostic tool *PTSCONFIG* at the CIC and the command **blink patient unit|bed***.
The IP address in the *lw* (listnetwork) doesn't match the labels on the Prism server.		Check that the IP labels match numbers in Windows NT, CIC, and ApexPro. 1. Use the service diagnostic tool *PTSCONFIG* at the CIC and the command **ipconfig**. 2. Verify that there are four IP addresses in the list. (Two MC 126.x.x.x addresses, one for CIC and one for ApexPro; IX 121.x.x.x or hospital IP; RX 119.1.1.2)
Dropout of patient waveform.	Vibration	

Event Logs

Events can be stored in two locations, the receiver system and the ApexPro host hard drive.

Receiver System Event Logs

Events logged to the receiver system are stored in flash memory and can be retrieved via the diagnostic service port. The system stores the events in two flash memory sectors. When the event storage maximum is reached, and a new event occurs, the flash sector with the oldest events is erased. New events are stored to that sector.

Access the receiver system event logs as follows.

1. Using the 9-pin, serial cable (PN 2003629-001) supplied with the transmitter programming kit, connect a PC to **Async Comm** (asynchronous serial communication).
2. At the PC, use a communication program such as Hyperterminal to set up the ComPort connection.
3. Press **Enter** to get the @> *Enter Service Password:* prompt.
4. Type password, **mms_aps** (case-sensitive).
5. Press **Enter**.

There is no command to view how many events are stored, but typically the most recent event will be examined first. Event 1 is the first (oldest) stored event.

Use the **del** (display error log) command with a parameter of 999 to determine the number of events stored. Since 999 is greater than the number of events that can be stored, the command errors and reports the number of events in the system.

6. At the @> prompt type **del 999** and press **Enter**. The following displays.

   @> del 999
   Record not present, XXX *records stored in system*.

   NOTE
   "XXX" is representative of the number of events stored in the error log. It will appear on screen as an actual number.

7. At the @> prompt type **del XXX** (where XXX equals the number of events as indicated in the error message) and press **Enter** to display the most recent event.

Other commands include:

- Type **,** (comma) and press **Enter** to display the previous log entry.
- Type **.** (period) and press **Enter** to display the next log entry.
- Type **dael** and press **Enter** to dump all entries. This is useful in conjunction with the "capture-to-file" feature of Hyperterminal.

The following is an example of the information in each event log.

Record Number 244

Date/Time:	1 January 2000 00:00
Error Code:	0x438a
Severity:	4
Error Text:	Set fields for rcvr 15 to 15
Process Name:	sysstart
Status Register:	0x9042
User Stack Pointer:	0xff0902c8
Program Counter:	0xff013a24
Super Stack Pointer:	0xffcbffe8
Heap Pointer:	0xff0c8554
Passed Parameter:	15
Error Number:	60544
Ticks:	525

The date and time are set by the Unity Information Server. If the date and time have not been updated by the time the event occurs, the time defaults to 1 January 1990 00:00.

The error text explains the error code.

The severity levels are:

4 = An event occurred, not an error

5 = A minor error

6 = An error that caused the system to halt

7 = An error that caused the system to reset

The number of ticks indicates when the event occurred relative to the last time the system was rebooted. There are 60 ticks in one second.

The *Passed Parameter*, in most cases but not all, indicates which receiver in the system logged the event. The receivers are indexed starting with 0.

ApexPro Host Event Logs

The receiver system also sends events to the ApexPro host. The ApexPro host stores event logs only when the receiver system is connected to the ApexPro host. Refer to the CIC and Unity Information Suite (IS) Server Service Manual for information on obtaining the logs from the ApexPro host.

Event logs may be requested by Tech Support to help diagnose the problem. The easiest way to save the logs to diskette is from the ApexPro host. Refer to the CIC and Unity Information Suite (IS) Server Service Manual for more information.

Disassembly Guidelines

General

WARNING
Patient monitoring interruption. Make sure a patient is not being monitored.

When removing the receiver subsystem pcb, use the following tools:

- 3-4 inch Phillips head screwdriver
- 12 inch Phillips head screwdriver
- 1/2 inch crescent wrench

PCB Assemblies

CAUTION
Solder multilayer and surface mount PCB assemblies at your own risk! Improper repair methods can damage the PCB assemblies even further and void the warranty. Only qualified service personnel with the proper laboratory equipment should attempt to repair PCB assemblies.

Observe the following guidelines when handling all PCB assemblies.

- Take precautions against electrostatic discharge damage.
- Handle all PCB assemblies by their edges.

Hardware

- Before disassembly, note the positions of any wires or cables, marking them if necessary to ensure that they are replaced correctly.
- Gray ribbon cables have retainer clips holding them in the connector.
- Save and set aside all hardware for re-assembly.

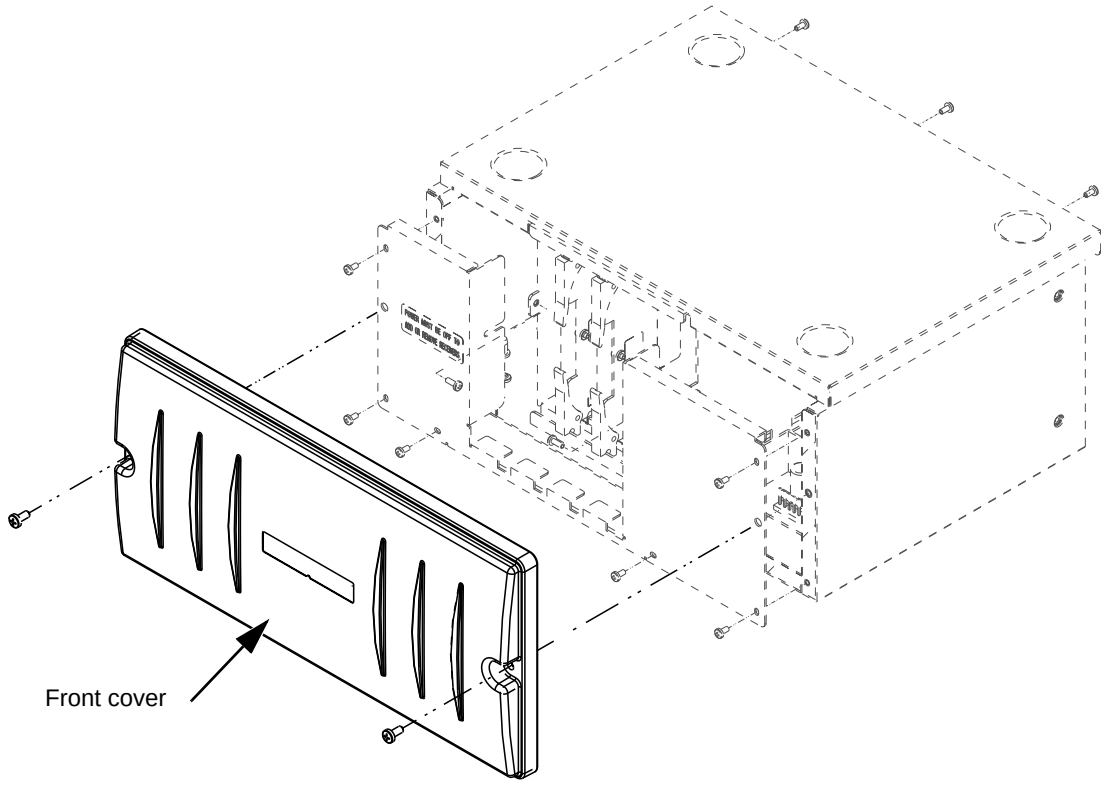
Replace the Fuse

1. Open the door on the AC inlet module to access the fuse holder.
2. Remove two fuses and replace with new on each side of the holder.
3. Close the AC inlet module doors.

Open the Unit

CAUTION
Equipment damage. Power must be off to add or remove any internal assemblies or circuit boards.

1. Turn the unit OFF at the rear power switch and disconnect the AC power cord and all communication cables.
2. Remove 2 screws from the front cover.
3. Remove cover and set aside.



Remove a Quad Receiver Module

CAUTION
Equipment damage. Do not remove or install Quad Receiver Modules with power applied.

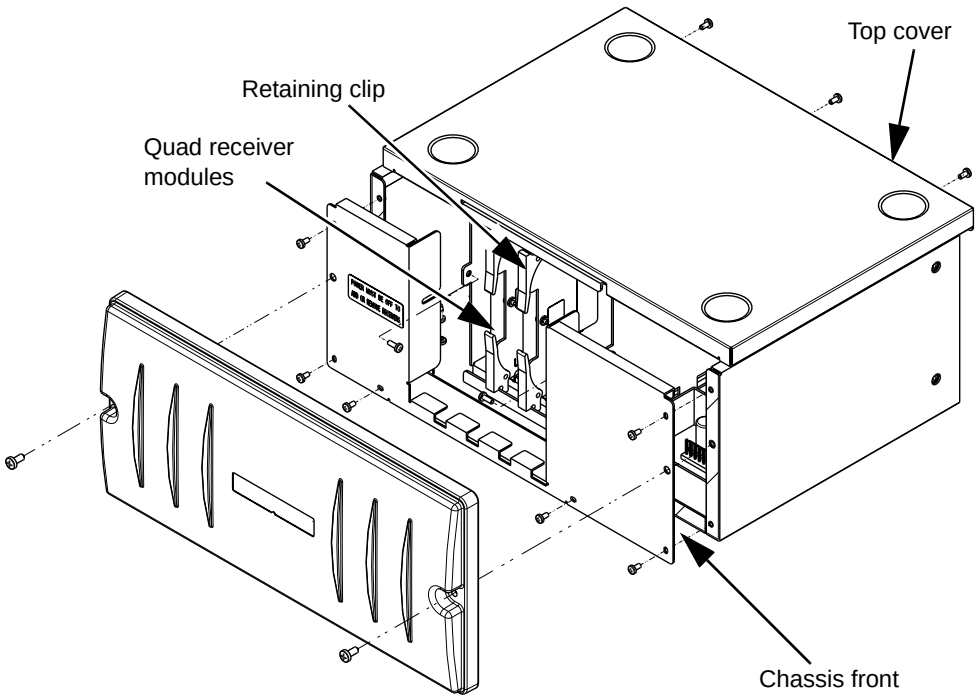
1. Remove the front cover as described above.
2. Unseat the quad receiver module by pulling the two retaining clips away from the module.
3. Pull module straight out of chassis.

Add a Quad Receiver Module

1. Remove the front cover as described above.
2. Position a quad receiver module with the protruding side (with label) facing the right side of the chassis.
3. Slide the protruding edge into the upper and lower chassis track.
4. Keep the retaining clips fully extended until the outer edges meet the receiver cage.
5. Fold the retaining clips inward, seating the module into the connector.

NOTE
Do not force the module or retaining clips. If it does not seat easily, the module may be upside down.

6. Replace the front cover.

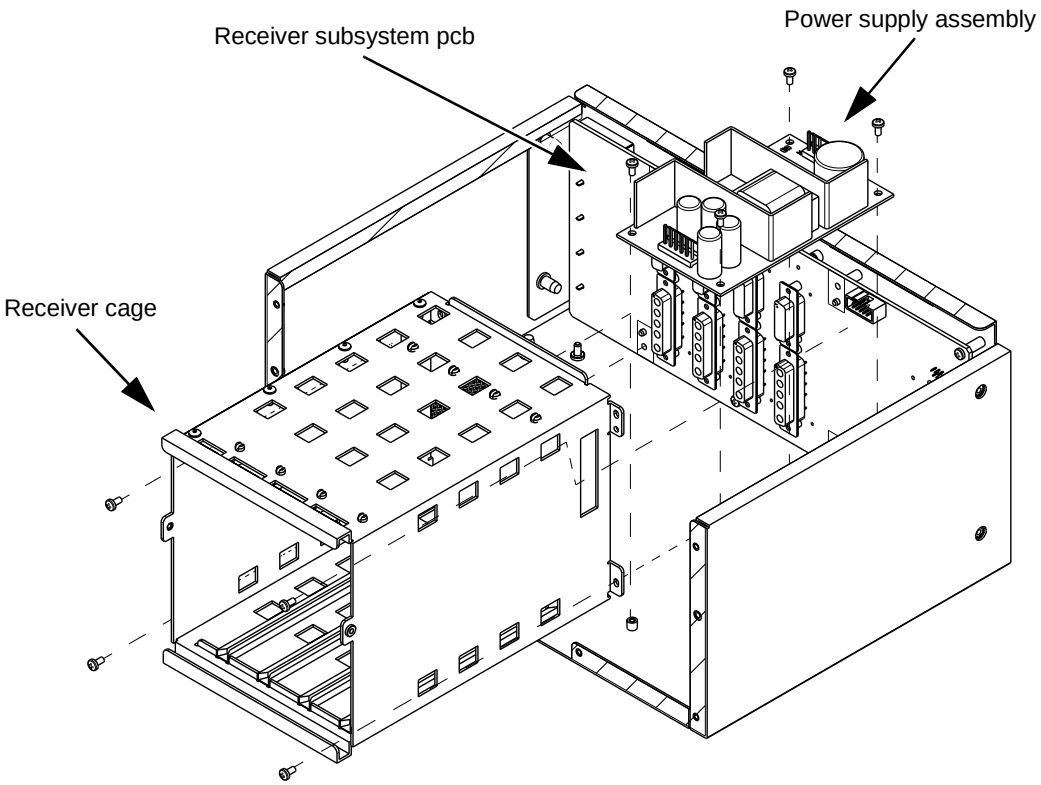


Remove/Replace the Power Supply Assembly

1. Remove the front cover as described above.
2. Remove 3 screws from the upper rear of the top cover.
3. Remove top cover.
4. Disconnect the power supply harness from the receiver subsystem pcb.
5. Remove 4 screws holding the power supply to the chassis assembly.
6. Remove power supply.
7. Reverse the above steps to install a power supply assembly.

Remove/Replace Receiver Subsystem PCB (Backplane)

1. Remove the front cover as described above.
2. Remove 3 screws from the upper rear of the top cover.
3. Remove top cover.
4. Remove all quad receiver modules.
5. Remover 6 screws from chassis front.
6. Using a short screwdriver loosen 2 screws inside the receiver cage.
7. Pull chassis front straight out.
8. Using a long screwdriver remove 4 screws holding receiver cage to receiver subsystem pcb.
9. Remove receiver cage.
10. Disconnect the power supply harness from the receiver subsystem pcb.
11. At the outside rear of the chassis assembly remove 4 hex nuts and washers.
12. Remove 7 screws holding pcb to chassis assembly.
13. Remove the receiver subsystem pcb.
14. Reverse the above steps to install a receiver subsystem pcb.



Close and Reconnect Unit

1. Position the front cover and install 2 screws.
2. Reconnect the power cord and all communication cables.
3. Refer to Chapter 4, Maintenance, and perform Checkout and Electrical Safety Test procedures.

Ordering Parts

General

The parts lists and assembly drawings in this chapter supply enough detail for you to order parts for the assemblies considered field serviceable. If you require additional information or troubleshooting assistance, contact Tech Support. Schematic diagrams are provided in the next chapter.

To order parts, contact Service Parts at the address or telephone number listed on the "How to Reach Us..." page found at the front of this manual.

Field Replaceable Units

The tables below list the most commonly replaced assemblies ordered in the service spare circuit board kits. See the operator's manual for a complete list of accessories and expendable supplies.

Field Replaceable Units	
Item	**Part Number**
Receiver System PCB Assembly, U.S. Receiver System PCB Assembly, international	801632-001 801632-002
